

# Wealthier farms and Healthier milk WITHOUT AFLATOXINS

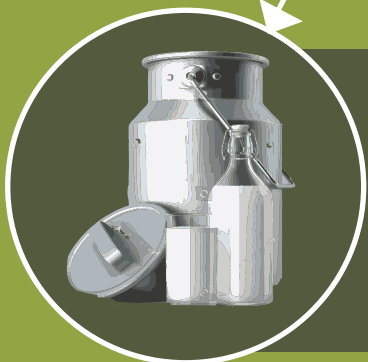

Aflatoxins are invisible toxic substances produced by molds that grows in foods and feeds kept in humid and hot places.

Aflatoxins can be found in commercial as well as home made feeds.

If animals eat aflatoxins, they produce less milk and grow less.

Milking cows transfer aflatoxins into the milk.

Drinking a lot of milk with aflatoxins is not good for health.

**GIVE** your milking cows and young animals feeds that are **NOT MOLDY** and that are **STORED** in a **DRY, COOL PLACE, SAFE FROM PESTS.**
