Foreword

Water is an economic and environmental resource that needs to be managed in an integrated manner to meet the challenges of climate change. The changing monsoon patterns are likely to result in significant changes to India's water availability and water management. To address these challenges, climate change adaptation measures need to be implemented.

The book "Water and Agriculture: The Indian Experience of Climate Change Adaptation" by A.K. Gosain and K. Parashar, discusses the various approaches to assess climate change impacts and develop adaptation strategies. The authors believe that the key to effective adaptation lies in involving stakeholders at all levels, including farmers, policymakers, and the general public. The book provides insights into how stakeholders can work together to address the impacts of climate change on agriculture.

The book would be useful for students, researchers, and policymakers who are interested in understanding the challenges and opportunities of climate change adaptation in the agricultural sector. It provides a comprehensive overview of the various approaches and strategies that can be implemented to address the impacts of climate change on agriculture in India.
