Introduction
Pastoralism is largely practiced in the arid and semi-arid land (ASAL) – 80% of Kenya’s landmass; 50% of Tanzania’s landmass. Livestock is main sources of livelihood of ASAL area inhabitants, but animal and public health challenges are faced by farmers.

Study AIM and OBJECTIVES
To describe the current animal health scenario and its implication for food safety based on data collected among pastoralists who enjoy substantial territorial occupancy in Kajiado county (Kenya), and Tanga and Morogoro regions (Tanzania).

Materials and methods
A total 238 farmers were interviewed in a cross section study in Kajiado county (Kenya), and Tanga and Morogoro regions (Tanzania). Total of 688 animals were serologically tested for Q fever.

Results

Veterinary services
Among 84% of respondents trust government veterinary services. Government veterinary offices are more 5 km away to 71% of the respondents.

Farmers and zoonosis
13% of respondents use unboiled milk. While 11% will eat on an animal that is sick from and Only 11% will handle aborted foetus with protective gear. Aborted material in 77 households are fed to dogs.

Veterinary Drugs
Easily accessible to 38% of respondents. Self administering of veterinary drugs to their animals by 71% of the respondents. Oxytetracycline and penicillin streptomycin were the most commonly stocked antibiotics at household level.

Food safety
Unclean milk harvesting. Consumption of uninspected meat. Consumption of animal that was on treatment Drinking of raw milk and raw milk products.

Reduced livestock assets
Drought
Compromised food safety

Research into use
• Upscale on regulation to access, prescription, storage and dispensing of veterinary drugs
• Enhance knowledge, skills and attitude of the pastoral communities on zoonosis
• Increase accessibility of government veterinary services for essence of disease control and extension services
