Orange-fleshed Sweetpotato on the Home Grown School Feeding Menu in Nigeria

Pottage made from orange-fleshed sweetpotato was included on the menu at eight schools in Osun State starting in late 2014. During the pilot period, which started in January 2015, 4,160 students in 8 schools were served 1.2 tons of OFSP each week, with increasing acceptance of the program by all stakeholders over time.

**What is the problem?**

Micronutrient deficiency is a serious public health problem in many developing countries, but unlike wasting, it is often difficult to recognize and thus referred to as Hidden Hunger. School feeding programs, which provide children with a nutritious meal daily, are recognized as an effective means to increase access to education and learning, and improve children’s health and nutrition, particularly as a part of comprehensive school health and nutrition programmes. When these programs source foods from local farmers, so-called homegrown school feeding (HGSF), they also support local agricultural economies and supply chains. The African Union’s (AU) Comprehensive Africa Agricultural Development Programme (CAADP) and the United Nations’ Committee on World Food Security have endorsed HGSF for these multiple benefits that can contribute to educational, nutrition, and agricultural outcomes. While sweetpotato is not yet a commercial crop in many places in Nigeria, the inclusion of OFSP on HGSF menus would do much to provide stable markets, stimulate OFSP production and nutrition value chains.

**Where are we working?**

Osun State, in the southwest of the country, has 31 Local Government Areas (LGAs). Schools in eight of these LGAs were chosen to pilot the inclusion of OFSP on the menu, starting in January of 2015.

**How are we making it happen?**

Exploratory work to include sweetpotato on the O-MEALS menu began with familiarization visits to the program as early as 2011, and continued with further visits and support to develop capacity over the next few years. Various partners, including staff of the O-MEALS program, the Osun State Agricultural Development Programme (OSADEP), the National Root Crops Research Institute, the Partnership for Child Development (PCD), and the office of the Governor of Osun...
In September 2014, the inclusion of OFSP on the school menu received high-level endorsement following a visit to the office of the Deputy Governor of Osun State. This was followed by approval by education stakeholders to include OFSP pottage on the menu of all schools in Osun State once a week. Due to logistical reasons, a pilot was initiated in eight schools in January 2015. The 4,160 students are consuming 1.2 tons of OFSP per week, served by 60 caterers (Fig. 3 and 4). With increasing numbers of meals served each week, there is also a growing acceptance of the meal by students.

What are the next steps?

Both the nutrition and business case for OFSP in the O-MEALS programme are strong, and the O-MEALS programme is anxious to expand coverage. At this early stage in the program, close monitoring to ensure adequate supply of sweetpotato, and timing of production to synchronize with the school calendar are needed to guide planned expansion of the program to all schools in Osun State and other states in Nigeria in the coming years.
