What decisions can women make in Surkhet, Nepal?
Women’s agency and perceptions of domestic violence

ABOUT THIS DATA NOTE | The Transforming Agrifood Systems in South Asia (TAFSSA) district agrifood systems assessment aims to provide a reliable, accessible, and integrated evidence base that links farm production, market access, dietary patterns, climate risk responses, and natural resource management with gender as a cross-cutting issue in rural areas of Bangladesh, India, and Nepal. It is designed to be a multi-year assessment. Using data collected in March–April 2023, this data note describes women’s say or agency in various household decisions, their physical and financial independence, their mobility, and their perceptions of domestic violence. This is one of a set of data notes that, together, provide a holistic picture of the agrifood system in the district.

OVERVIEW OF CONTENTS

TAFSSA’s district agrifood systems assessment aimed to interview three respondents per household: a female adult (aged 20+ years), a male adult (aged 20+ years), and an adolescent (aged 10-19 years). Information on the household and respondent sampling strategy is provided at the end of this data note.

In this data note, you will get a picture of critical aspects of women’s empowerment for the surveyed adult women (from the survey households), based on their responses. It begins with an introduction to background characteristics of these households, providing essential context for the sample. From there, we delve into indicators of women’s financial and physical independence.

You will also get insight into what decisions women can make. Respondents were asked who in the house is responsible for various decisions involving women’s own health, child-related matters, expenditures, agriculture, and food. Then we examine aspects of women’s mobility, as indicated by whether they need permission to travel to various destinations, including in the neighborhood, markets, healthcare facilities, or religious sites. You will also learn about their attitudes toward domestic violence against women in various scenarios that they may encounter in their daily lives.

Finally, we present a comparative picture for a selected set of these indicators between households with and without any adult male members. This provides a sense of the impact of adult men’s presence or absence on intrahousehold decision-making and mobility among adult women. More detail about the measurement methods are found in the following pages.

Figure 3. Financial independence of respondent women

- Have own money to use: 64%
- Have own bank account: 49%
- Ever used this bank account*: 83%
- Have own mobile bank account: 6%

Figure 4. Frequency of women respondents meeting or talking to maternal family members

- Never: 15%
- Once a year: 25%
- Several times a year: 16%
- Several times a month: 18%
- Once a week: 24%
- Several times a week: 2%

Notes: Figure 3 shows ownership of financial assets by respondents. They were asked direct questions about these assets that could be answered in yes or no. ‘Have own money to use’ denotes the percentage of respondents with personal funds, in any form, available for discretionary use. *248 women who answered yes to having own bank account were asked if they ever used it. Figure 4 shows the frequency of traveling outside of the home to meet maternal family members.

FINDINGS
- While 64% women have their own money to use, only half the respondents have a bank account.
- There is some variation in frequency of visiting their maternal family—about 1/4th of women visit their maternal family once a year or once a week.

Expenditure on men's health

Expenditure on children's health

Note: This figure shows who in the household participates when decisions are being made about different health-related issues. ‘Others’ refers to household members other than spouse and/or non-household members.

FINDINGS

✓ Few women can make decisions alone. Most of them take decisions jointly with their spouse or other household members.
✓ Most women take decisions about their own health alone in households without adult men.

What to grow in the home/kitchen garden

What crops to cultivate in the field

Use of fertilizer

What foods are bought for the household

What foods to prepare on a day-to-day basis

Note: This figure shows who in the household participates when decisions are being made about different agriculture and food related issues. ‘Others’ refers to household members other than spouse and/or non-household members.

FINDINGS
✓ A substantial proportion of women take decisions related to home gardens and crop cultivation alone in households without adult men.
✓ Most women decide what foods to prepare in all households, with or without adult men.
Women’s decision-making power

68% of women from households with adult male members decide alone what foods to prepare, but only 40% of women in these households decide alone what foods to purchase.

Figure 8. Respondent women needing permission from a household member to travel to various places in households with and without any adult men

Note: This figure shows the share of women who need to ask permission from a household member to travel outside of their houses to various places in and around the village. The respondents were presented with the option “not applicable” if they do not travel to a specific place that was asked about in the questionnaire.

FINDINGS
✓ Many women from households without adult men do not need permission from a household member to travel to nearby places, religious places or places within the village.
✓ Most women always need permission to travel outside the village.
Women’s physical autonomy

35% of women always need permission to visit public village meetings in households with adult men, while 13% always need permission in households without adult men.

Note: This figure shows women’s perceptions about a husband hitting his wife. Women respondents were presented with multiple common scenarios and asked if they think a husband is justified in hitting his wife in those scenarios. “Any of the above scenarios” refers to responding yes to any one of the scenarios presented. The sample includes all households with or without adult men.

### FINDINGS

- About 1/5th of the women respondents justify hitting from husband in any scenario presented to them.
KEY TAKEAWAYS
1. Average years of education of adult women 20-79 years old with an adolescent residing in their household is only 4 years.
2. Every 7 in 10 women are employed, with 72% of women engaged in farming activities.
3. Financial inclusion is limited, half of the women have a bank account but only 6% of women have a mobile bank account.
4. Decision-making agency of women is low, as women take most decisions jointly with their spouse or other household members. Women have the most say only in food preparation decisions.
5. Most women always require permission to travel outside village.
6. About one-fifth of the women agree that a husband is justified in hitting his wife in one or more day-to-day scenario.

KEY QUESTIONS FOR ACTION
1. What are the barriers to financial inclusion and how could financial independence be promoted among women?
2. What strategies can promote equal say for women in household decisions, especially concerning their own health?
3. What measures can households endorse and support to improve women's autonomy?

SURVEY METHODOLOGY
Ward and household sampling
We selected 25 wards in the district with a probability proportional to the number of households that reside in each ward. Within each ward, we conducted a household listing to identify eligible households, that is, those with adolescents (10-19 years old). From the households with adolescents, we randomly invited 20 households to participate in the survey. If a household refused, we replaced that household with another randomly selected eligible household, to retain a total of 500 households in the district. Thus, the findings reported in this data note are representative of rural households from this district that include an adolescent.

Respondent selection
Within households, one adult female aged 20+ years, one adult male aged 20+ years, and one adolescent aged 10-19 years were selected as the respondents for the survey. When multiple adolescents were living in a household, the oldest adolescent was selected. In some households, an adult male was not available (often due to migration for work). In such households, the female was the only adult respondent (see Table 1 for respondent sample sizes). At the beginning of the interview, the adult in the household primarily involved in agriculture (either male or female) and the adult primarily responsible for food purchasing (either male or female) were identified as the primary respondents.
